

PROJECT SCOPE STATEMENT	
Project Name	HomeGigs
Project Deliverables	Detailed Description
Dual Portal System	The application includes 2 separate systems throughout the platform. One dashboard accompanies the customer's portal while the other accompanies the worker's portal. They both have separate log in and registration pathways.
Gig Marketplace	The application provides a gig marketplace that is handled by both customers and workers. The customers post gigs or services by providing its description, budget, location, images, date, and time. The workers browse these gigs based onto categories or time schedules.
Bargain Opportunity	The application anticipates a bargain option for the workers so they can negotiate the budget with the customers and decide if the gig is worth enough to accept or not. Similarly, the customer can also chat with the worker once the worker is willing to accept a gig, and they both can accept the gig to be done on a mutually agreed price.
Project Exclusions	Detailed Description
Payment Method	The application does not provide an authentic payment system just like current apps that are used worldwide. Payment methods by any cards are not involved in the application due to no authority towards any real-life backend encryption, bank to bank transfers, or third-party payment gateway integration systems.
Background Checks	The application is not associated with any external media to serve as a background verifying source. There is no authentic way of finding out if a worker has a clean criminal background and has authentic certificates for all the respective skills.
Real Life GPS	The application does not have any patent to track down live location of the workers to estimate the arrival time of the worker and completion time of the gigs under process. It is all just on a virtual display which indicates that a worker is assigned to a gig and nothing more in detail.
